

# Recipes

---

## Day 1

A controller has already been created called Recipe. Your job is to develop different views for a Recipe List based on the visuals provided in the [etc/Day 1](#) folder.

1. One view is a tile view
2. One view is a table view

Model classes representing a [Recipe](#) and an [Ingredient](#) have been provided for you. **Do not modify or change any of the model's properties** for this exercise.

Recipe images have been provided in your repository.

## Day 2

1. Convert your existing pages to use a shared layout view so that each view is not continually repeating the site template.
2. Make the Table and Tile view have clickable links that redirect the user to a recipe detail view. Suggestions include making the image clickable, the recipe name clickable, etc.
3. Implement the Detail View for your individual recipe per the screenshot in the [etc/Day 2](#) folder.
